

Connection Cable for Left Side

This cable connects the main board to the left side piece. It carries the power and the signal for the multi-coloured LEDs. Connect from the main board (front Right) to the top set of 3 pins on the left side. The Brown wire should be at the front of the robot for both connectors – ie. do not twist the cable. After this cable is connected, the LEDs on the left side will flash different colours with the different directions that the wheel moves.
