

Connection Cable for Right Side

This cable connects the left side piece to the right side piece. It carries the power and the signal for the multi-coloured LEDs. Connect from the bottom set of pins on the left side to the top set of 3 pins on the right side. The Brown wire should be at the front of the robot for both connectors – ie. do not twist the cable. It may be easier to remove the first cable temporarily from the top set of pins, so you can get to the bottom set more easily. After this cable is connected, the LEDs on the both sides will flash different colours with the different directions that the wheels move.
