

Front Sensor

This little sensor assembly is made using 2 microswitches which can be used to detect obstacles in front of Santa's Sleigh. We don't want it crashing into things do we?

Use the three screws from yesterday's bag to go through the sensor board from the top, then through the main chassis and then screw them into the nuts underneath. Tighten the screws up well so that they make good connections. Now see what happens when the sensors detect an obstacle.
